Care instructions

Limestone and marble is very sensitive to products containing acids (wine, citrus fruits, carbonic acid, vinegar etc). Grease and oil stains must be removed as quickly as possible to prevent them from entering the stone.

All limestone and marble countertops should be professionally sealed. After that they should be sealed again at least once a year to prevent staining. The impregnation is not visible but makes the stone more resistant to grime and liquid, although it does not offer complete protection against stains.

For daily cleaning, a microfibre cloth moistened with water is sufficient. In the event of stains or slight soiling of the countertop, do not use low pH (acidic) or abrasive cleaners (JIF Scrub Cream etc.). These can damage your stone countertop.

In case of any stains or slight soiling of the worktop a PH neutral natural soap is recommended.
